(54) Title: **HEXADENTATE LIGAND AND CATALYTIC COMPLEX THEREWITH**

(57) Abstract: A hexadentate ligand for polymerization of olefins including chemical structure(I) is provided: R1, R2, and R3 of chemical structure (I) are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group; R4 and R5 are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl; Y1 is a structural bridge; and W, Y1, and Z are independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl having from about 0 to about 30 carbon atoms. In another embodiment of chemical structure I, W, Y1, and Z are selected to produce chemical structure (II): R6, R7, R8, R9, and R10 of chemical structure (II) are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl; RA, RB, RC, and RD are each independently hydrogen, fluorine, an inert functional group, a primary carbon group, a secondary carbon group, or a tertiary carbon group; Y2 is a structural bridge between two halves of the structure, and more particularly may be a bond, a hydrocarbyl group comprising from about 0 to about 20 carbon atoms, methylene (CH2), ethylene (C2H4), or an inert functional group; and any two of RA, R6, R7, RB, RC, R8, R9, R10, and RD, or any portion of Y2, vicinal to one another, taken together may form a ring.

- as to the applicant's entitlement to claim the priority of the earlier application (Rule 4.17(iii)) for all designations
- of inventorship (Rule 4.17(iv)) for US only

- before the expiration of the time limit for amending the claims and to be republished in the event of receipt of amendments

[0003] Not applicable.

FIELD OF THE INVENTION

[0004] The present application relates generally to olefin oligomerization. More particularly, the present application relates to a novel hexadentate ligand, associated hexadentate bimetallic complex, and methods of making such hexadentate ligands and complexes. Additionally, the hexadentate ligand and complex are employed in the oligomerization of olefins.

BACKGROUND OF THE INVENTION

[0005] Olefins, also commonly known as alkenes, are important items of commerce. Their many applications include employment as intermediates in the manufacture of detergents, as more environmentally friendly replacements where refined oils might otherwise be used, as monomers, and as intermediates for many other types of products. An important subset of olefins are olefin oligomers, and one method of making olefin oligomers is via oligomerization of ethylene, which is a catalytic reaction involving various types of catalysts. Examples of catalysts used commercially in polymerization and oligomerization of olefins include alkylaluminum compounds, certain nickel-phosphine complexes, and a titanium halide with a Lewis acid, such as diethylaluminum chloride.

[0006] Another group of olefin polymerization catalysts is derived from pyridine bisimines. With catalysts of this type, a nitrogen-based ligand engages in a coordination reaction with a transition metal salt. The coordination reaction forms a metal complex, which is a catalyst precursor. The metal complex further reacts with another precursor or activator to generate a

metal alkyl or metal hydride species. The catalyst resulting from the generation of the metal alkyl or metal hydride species polymerizes olefins.

[0007] Applications and demand for olefin polymers and oligomers continue to multiply, and competition to supply them correspondingly intensifies. Thus, additional novel and improved catalysts and methods for olefin polymerization and oligomerization are desirable.

SUMMARY OF THE INVENTION

[0008] A hexadentate ligand for polymerization of olefins including chemical structure I is provided:

I

R₁, R₂, and R₃ of chemical structure I are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group; R₄ and R₅ are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl; Y₁ is a structural bridge; and W, Y₁, and Z are independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl having from about 0 to about 30 carbon atoms. In an embodiment of chemical structure I, the groups W, Y₁, and Z are selected such that an activated transition metal complex of the ligand, in the presence of one or more monomers under suitable polymerization conditions, results in a polymerization product having greater than about 50 weight percent oligomers having from about 4 to about 30 carbon atoms. In another embodiment, chemical structure I includes a mirror plane. In another embodiment of chemical structure I, the groups W, Y₁, and Z are selected to produce chemical structure II:

II

R₆, R₇, R₈, R₉, and R₁₀ of chemical structure II are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl; R_A, R_B, R_C, and R_D are each independently hydrogen, fluorine, an inert functional group, a primary carbon group, a secondary carbon group, or a tertiary carbon group; Y₂ is a structural bridge between two halves of the structure, and more particularly may be a bond, a hydrocarbyl group comprising from about 0 to about 20 carbon atoms, methylene (CH₂), ethylene (C₂H₄), or an inert functional group; and any two of R_A, R₆, R₇, R_B, R_C, R₈, R₉, R₁₀, and R_D, or any portion of Y₂, vicinal to one another, taken together may form a ring.

[0009] In another embodiment, a hexadentate bimetallic complex having chemical structure III, and method of producing same, is provided:

III

$R_1, R_2, R_3, R_4, R_5, W, Z$, and Y are as defined above for chemical structure I. M_1 and M_2 are metal atoms that may be independently selected from the group consisting of cobalt, iron, chromium, and vanadium; each X may be an anion, such as a halide or acetyl acetonate, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 ; and n is 1, 2, or 3, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 .

[0010] In another embodiment, a hexadentate bimetallic complex having chemical structure IV, and method of producing same, is provided:

IV

[0011] The method for producing chemical structure IV includes mixing a pyridine compound having chemical structure V:

V

with a substituted arylene diamine having chemical structure VI:

VI

and a substituted aryl amine having chemical structure VII:

VII

in a suitable solvent; and adding at least one metal salt of the formula MX_n . R_1 , R_2 , and R_3 of chemical structure IV are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group; R_4 and R_5 are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl; R_6 , R_7 , R_8 , R_9 , and R_{10} are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl; R_A , R_B , R_C , and R_D are each independently hydrogen, fluorine, an inert functional group, a primary carbon group, a secondary carbon group, or a tertiary carbon group; Y_2 is a structural bridge between two halves of the structure, and more particularly may be a bond, a hydrocarbyl group comprising from about 0 to about 20 carbon atoms, methylene (CH_2), ethylene (C_2H_4), or an inert functional group; any two of R_A , R_6 , R_7 , R_B , R_C , R_8 , R_9 , R_{10} , and R_D , or any portion of Y_2 , vicinal to one another, taken together may form a ring; M_1 and M_2 are independently selected metal atoms that are selected from a group comprising cobalt, iron, chromium, and vanadium; each X is an anion; and n is 1, 2, or 3, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 .

[0012] In another embodiment, a method for preparing a polymerization catalyst system is provided. Such method includes executing a coordination reaction between a hexadentate ligand having chemical structure II:

II

and a metal salt of the formula MX_n , to form a hexadentate bimetallic complex having chemical structure IV:

IV

The method also includes generating a metal alkyl or metal hydride species; and contacting the catalyst system with one or more monomers under suitable reaction conditions to polymerize the monomer. R_1 , R_2 , and R_3 of chemical structures II and IV are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group; R_4 and R_5 are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl; R_6 , R_7 , R_8 , R_9 , and R_{10} are each independently hydrogen,

hydrocarbyl, an inert functional group, or substituted hydrocarbyl; R_A , R_B , R_C , and R_D are each independently hydrogen, fluorine, an inert functional group, a primary carbon group, a secondary carbon group, or a tertiary carbon group; Y_2 is a structural bridge between two halves of the structure, and more particularly may be a bond, a hydrocarbyl group comprising from about 0 to about 20 carbon atoms, methylene (CH_2), ethylene (C_2H_4), or an inert functional group; any two of R_A , R_6 , R_7 , R_B , R_C , R_8 , R_9 , R_{10} , and R_D , or any portion of Y_2 , vicinal to one another, taken together may form a ring; M_1 and M_2 are independently selected metal atoms that are selected from a group comprising cobalt, iron, chromium, and vanadium; each X is an anion; n is 1, 2, or 3, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 ; and olefins may or may not be present at the step of generating a metal alkyl or metal hydride species.

DETAILED DESCRIPTION OF EMBODIMENTS

[0013] The present application discloses a hexadentate ligand (or "ligand"), illustrated by chemical structure I, that is employed in the making of catalysts for polymerizing and oligomerizing olefins.

[0014] Embodiments of the various types and combinations of "R" groups are defined below. The hexadentate ligand structure may be identified by six nitrogens denoted by reference numerals 10, 20, 30, 40, 50, and 60, wherein the ligand may be viewed as consisting of two halves or sides; one side including nitrogen groups 10, 20, and 30, and the other side including nitrogen groups 40, 50, and 60. The two halves are connected by a structural bridge Y_1 . When producing a metal complex from the hexadentate ligand, the ligand is reacted with the salt of a transition metal. A coordination reaction between the hexadentate ligand of chemical structure I and a metal salt forms a hexadentate bimetallic complex (or "complex"),

such as the one illustrated by chemical structure III, which includes two different sites 70 and 80 where the metal salt may coordinate with the ligand. The hexadentate bimetallic complex of chemical structure III is a precursor to the catalyst for polymerizing and oligomerizing olefins.

III

[0015] In an embodiment, the components of the hexadentate ligand of structure I and hexadentate bimetallic complex of structure III, labeled as R_1 , R_2 , R_3 , R_4 , R_5 , W , Y_1 , Z , M , and X_n are as follows:

R_1 , R_2 , and R_3 are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group, as defined below;

R_4 and R_5 are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl;

Y_1 is a structural bridge between the two halves of the ligand and may be a bond between nitrogen group 30 and nitrogen group 40; or Y_1 is a structural bridge wherein Y_1 , W , and Z are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl including from about 0 to about 30 carbon atoms;

M_1 and M_2 are metal atoms that may be independently selected from the group consisting of cobalt, iron, chromium, and vanadium;

each X may be an anion, such as a halide or acetyl acetate, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 ; and

n is 1, 2, or 3, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 .

[0016] In an embodiment of the ligand and complex of structures I and III, R_1 , R_2 , R_3 , R_4 , and R_5 are defined as above; and W , Y_1 , and Z are selected such that an activated transition metal complex of the ligand, in the presence of one or more monomers under suitable

polymerization comonomers, results in a polymerization product having greater than about 50 weight percent oligomers having from about 4 to about 30 carbon atoms. In another embodiment, each half of the hexadentate ligand of chemical structure I and each half of the hexadentate complex of chemical structure III is a mirror image of the other. The two halves, one denoted by nitrogen groups 10, 20, and 30, and the other denoted by nitrogen groups 40, 50, and 60, are divided by a mirror plane that passes through Y₁. In yet other embodiments of the ligand of structure I and complex of structure II, the structural bridge Y₁ may be cyclohexane.

[0017] In an embodiment of the hexadentate ligand illustrated by structure I, the groups W, Y₁, and Z are selected to produce the hexadentate ligand illustrated by chemical structure II:

II

[0018] When preparing a catalyst for olefin polymerization or oligomerization, the hexadentate ligand illustrated by structure II is reacted with a metal salt such that a coordination reaction results in the hexadentate bimetallic complex of structure IV:

IV

[0019] The groups R_A , R_B , R_C , and R_D are ortho to the amines. In an embodiment of the hexadentate ligand II and complex IV, the following pendant groups are defined:

R_1 , R_2 , and R_3 are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group, as defined below;

R_4 and R_5 are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl;

R_6 , R_7 , R_8 , R_9 , and R_{10} are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl, as defined below;

R_A , R_B , R_C , and R_D are independently selected from hydrogen, fluorine, an inert functional group, a primary carbon group, a secondary carbon group, or a tertiary carbon group;

M_1 and M_2 are metal atoms that may be independently selected from the group consisting of cobalt, iron, chromium, and vanadium;

each X may be an anion such as a halide or acetyl acetonate, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 ;

n is 1, 2, or 3, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 ;

Y_2 is generally a structural bridge between two halves of the structure, and more particularly may be a bond between rings 120 and 130, a hydrocarbyl group including from about 0 to about 20 carbon atoms, methylene (CH_2), ethylene (C_2H_4), or an inert functional group; and

any two of R_A , R_6 , R_7 , R_B , R_C , R_8 , R_9 , R_{10} , R_D , and any portion of Y_2 , vicinal to one another, taken together may form a ring.

[0020] In another embodiment of the hexadentate ligand II and complex IV, the pendant groups are as defined above, with the exception that:

when R_A is a primary carbon group, then none, one, or two of R_B , R_C , and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B , R_C , and R_D are hydrogen or fluorine; or

when R_A is a secondary carbon group, then none, one, or two of R_B , R_C and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B , R_C , and R_D are hydrogen or fluorine; or

when R_A is a tertiary carbon group, then none or one of R_B , R_C , and R_D are tertiary, phenyl, or substituted phenyl, and the remainder are hydrogen or fluorine; and

when R_C is a primary carbon group, then none, one, or two of R_A , R_B , and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine; or

when R_C is a secondary carbon group, then none, one, or two of R_A , R_B and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine; or

when R_C is a tertiary carbon group, then none or one of R_A , R_B , and R_D are tertiary, phenyl, or substituted phenyl, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine.

[0021] In an embodiment, the ligand II and complex IV may be viewed as consisting of two halves or sides; one side including rings 100, 110, and 120, and the other side including rings 130, 140, and 150. The two halves are connected by a structural bridge Y_2 . In another embodiment, one side of the hexadentate structure identified by rings 100, 110, and 120 is a mirror image of the other half of the structure, which is identified by rings 130, 140, and 150. The two halves or sides of the structure are divided by a mirror plane, which passes through Y_2 . In another embodiment, Y_2 connects rings 120 and 130 at their respective meta positions and the R_7 groups are located at the respective para positions.

[0022] Referring to the hexadentate complex IV, other distinctive embodiments of the ligand and complex may result because the rings 100, 120, 130, and 150 may rotate at their chemical bonds. For example, the ring 130 may rotate at its bonds 230 and/or 240 such that the resultant ligand or complex is not a true mirror image. In the case of a 180 degree rotation of the ring 130 along the bonds 230 and 240, as illustrated, the groups R_A and R_6 may rotate to the inside of the structure, and the groups R_B and R_7 may rotate to the outside of the structure.

Similarly, ring 100 may rotate along bond 260; ring 120 may rotate along bonds 210 and 220; ring 130 may rotate along bonds 230 and 240; and/or ring 150 may rotate along bond 250.

[0023] In another embodiment of the ligand II and complex IV, R_A , R_B , R_C , and R_D are selected such that an activated transition metal complex, in the presence of one or more monomers under suitable polymerization conditions, results in a polymerization product having greater than about 50 weight percent oligomers having from about 4 to about 30 carbon atoms.

[0024] In the following embodiments, unless otherwise specified, all groups other than the key pendant groups are as defined above. In an embodiment of the ligand II and complex IV, R_A and R_B are hydrogen; and R_C and R_D are each independently methyl, ethyl, propyl, or isopropyl. In an embodiment, R_A and R_B are methyl; and R_C and R_D are each independently methyl, ethyl, propyl, or isopropyl. In an embodiment, R_C and R_D are hydrogen; and R_A and R_B are each independently methyl, ethyl, propyl, or isopropyl. In an embodiment, R_C and R_D are methyl; and R_A and R_B are each independently methyl, ethyl, propyl, or isopropyl. In an embodiment, R_A and R_D are hydrogen; and R_B and R_C are each independently methyl, ethyl, propyl, or isopropyl. In an embodiment, R_A and R_D are methyl; and R_B and R_C are each independently methyl, ethyl, propyl, or isopropyl.

[0025] In an embodiment of a hexadentate bimetallic complex III or IV, pendant groups may be as defined above, except that both M_1 and M_2 are cobalt. In another embodiment, both M_1 and M_2 are iron. In another embodiment, one of the metal atoms, M_1 or M_2 , is iron, and the other is cobalt. In another embodiment, selection of M_1 and M_2 affects selection of R_A , R_B , R_C , R_D , W , Y_1 , and Z .

[0026] In an embodiment of a hexadentate bimetallic complex III or IV, including pendant groups as defined above, an activated complex results in an alpha olefin product having greater than about 80 percent 1-alkene content.

[0027] In an embodiment of a complex IV, pendant groups may be as defined above, with the following exceptions:

R_1 , R_2 , and R_3 are hydrogen;

R_4 and R_5 are methyl or hydrogen;

R_6 , R_7 , R_8 , R_9 , and R_{10} are hydrogen; and

R_A , R_B , R_C , and R_D are each independently methyl, ethyl, propyl, or isopropyl.

[0028] In the following embodiments of a complex IV, pendant groups may be as defined above, except that M_1 and M_2 are iron, and R_4 and R_5 are methyl. In an embodiment, R_A and R_B are hydrogen, and R_C and R_D are methyl. In an embodiment, R_A and R_B are methyl, and R_C and R_D are hydrogen. In another embodiment, R_A and R_C are methyl, and R_B and R_D are hydrogen.

[0029] For purposes of this application, a hydrocarbyl group is a group containing only carbon and hydrogen. If not otherwise stated, it is preferred that hydrocarbyl groups herein contain 1 to about 30 carbon atoms. The terms "hydrocarbyl" and "alkyl" are equivalent, and may be used interchangeably.

[0030] For purposes of this application, a substituted hydrocarbyl is a hydrocarbyl group which contains one or more substituent groups which are inert under the process conditions to which the compound containing these groups is subjected. The substituent groups also do not substantially interfere with the process. If not otherwise stated, it is preferred that substituted hydrocarbyl groups herein contain 1 to about 30 carbon atoms. Included in the meaning of "substituted" are heteroaromatic rings.

[0031] For purposes of this application, an inert functional group is a group, other than hydrocarbyl or substituted hydrocarbyl, which does not substantially interfere with any process described herein where the compound in which it is present takes part. Examples of inert functional groups include halo (fluoro, chloro, bromo and iodo), or ethers such as $-OR_{18}$ wherein R_{18} is hydrocarbyl or substituted hydrocarbyl. In cases in which the functional group may be near a metal atom, such as R_4 , R_5 , R_8 , R_B , R_C , and R_D the functional group should not coordinate to the metal atom more strongly than the groups in compounds containing R_4 , R_5 , R_8 , R_B , R_C and R_D which are shown as coordinating to the metal atom, that is they should not displace the desired coordinating group.

[0032] For purposes of this application, a primary carbon group includes a group of the formula $-CH_2-$, wherein the free valence is to any other atom (the bond represented by the hyphen is to the benzene ring to which the primary carbon group is attached). Thus, the free valence may be bonded to a hydrogen atom, halogen atom, carbon atom, oxygen atom, sulfur atom, etc. In other words, the free valence may be to hydrogen, hydrocarbyl, substituted hydrocarbyl or a functional group. Examples of primary carbon groups include $--CH_3$, $--CH_2$ $CH(CH_3)_2$, $--CH_2$ Cl, $--CH_2$ C_6H_5 , and $--CH_2$ OCH_3 .

[0033] For purposes of this application, a secondary carbon group includes a group of the formula $-CH=$, wherein the free valences are to any other atoms (the bond represented by the hyphen is to the benzene ring to which the secondary carbon group is attached). Thus, the free valences may be bonded to a hydrogen atom, halogen atom, carbon atom, oxygen atom, sulfur atom, etc. In other words, the free valences may be to hydrogen, hydrocarbyl, substituted hydrocarbyl or a functional group. Specific examples of secondary carbon groups include $-CH(CH_3)_2$, $-CHCl_2$, $-CH(C_6H_5)_2$, cyclohexyl, $-CH(CH_3)OCH_3$, and $-CH=CHCH_3$.

[0034] For purposes of this application, a tertiary carbon group includes a group of the formula $-C\equiv$ wherein the free valences are to any other atoms. Thus, the free valences may be

bonded to a hydrogen atom, halogen atom, carbon atom, oxygen atom, sulfur atom, etc. In other words, the free valences may be to hydrogen, hydrocarbyl, substituted hydrocarbyl or a functional group. Examples of tertiary carbon groups include: $-\text{C}(\text{CH}_3)_3$, $-\text{C}(\text{C}_6\text{H}_5)_3$, $-\text{CCl}_3$, $-\text{C}(\text{CH}_3)_2\text{OCH}_3$, $-\text{C}\equiv\text{CH}$, $-\text{C}(\text{CH}_3)\text{CH}=\text{CH}_2$, C_6H_5 , CF_3 , and 1-adamantyl.

[0035] In an embodiment, a method for producing a hexadentate bimetallic complex is provided. The method comprises mixing a pyridine compound having chemical structure V:

V

with a substituted arylene diamine having chemical structure VI:

VI

and a substituted aryl amine having chemical structure VII:

VII

The compounds having chemical structures V, VI, and VII may be mixed in a suitable solvent, as those are commonly known in the art. In an embodiment, the hexadentate ligand and bimetallic complex may be made up of the compounds having chemical structures V, VI, and VII in the following ratios: 2 parts chemical structure V, 1 part chemical structure VI, and 2 parts chemical structure VII. In an embodiment, the relative amounts of the

compounds and order of mixing the compounds may be selected in order to maximize the yield of the hexadentate ligand of structure II. Subsequently, a metal salt of the form MX_n , as defined above, may be added to the mixture forming a hexadentate bimetallic complex having chemical structure III or IV. In an embodiment, the pendant groups of complex III or IV formed by the above method may be defined as follows:

R_1 , R_2 , and R_3 are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group, as defined below;

R_4 and R_5 are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl;

R_6 , R_7 , R_8 , R_9 , and R_{10} are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl, as defined below;

R_A , R_B , R_C , and R_D are independently selected from hydrogen, fluorine, an inert functional group, a primary carbon group, a secondary carbon group, or a tertiary carbon group;

M_1 and M_2 are metal atoms that may be independently selected from the group consisting of cobalt, iron, chromium, and vanadium;

each X may be an anion such as a halide or acetyl acetate, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 ;

n is 1, 2, or 3, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 ;

Y_2 is generally a structural bridge between two halves of the structure, and more particularly may be a bond between rings 120 and 130, a hydrocarbyl group including from about 0 to about 20 carbon atoms, methylene (CH_2), ethylene (C_2H_4), or an inert functional group; and

any two of R_A , R_6 , R_7 , R_B , R_C , R_8 , R_9 , R_{10} , R_D , and any portion of Y_2 , vicinal to one another, taken together may form a ring.

[0036] In an embodiment of the above method, a hexadentate ligand having chemical structure I or II is formed as an intermediate that may be involved in a coordination reaction to produce a hexadentate bimetallic complex having chemical structure III or IV. In another embodiment of the above method, a hexadentate ligand having chemical structure II is formed as an intermediate, wherein ligand purity is at least about 90 percent when measured by nuclear magnetic resonance spectroscopy (NMR). In another embodiment, the two halves of the hexadentate ligand and complex formed by the above method are divided by a mirror plane. In another embodiment, the pendant groups are as defined in the above method, except that:

M_1 and M_2 are iron;

when R_A is a primary carbon group, then none, one, or two of R_B , R_C , and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B , R_C , and R_D are hydrogen or fluorine; or

when R_A is a secondary carbon group, then none, one, or two of R_B , R_C and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B , R_C , and R_D are hydrogen or fluorine; or

when R_A is a tertiary carbon group, then none or one of R_B , R_C , and R_D are tertiary, phenyl, or substituted phenyl, and the remainder are hydrogen or fluorine; and

when R_C is a primary carbon group, then none, one, or two of R_A , R_B , and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine; or

when R_C is a secondary carbon group, then none, one, or two of R_A , R_B and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine; or

when R_C is a tertiary carbon group, then none or one of R_A , R_B , and R_D are tertiary, phenyl, or substituted phenyl, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine.

[0037] In another embodiment, the order of mixing of the arylene diamine and the substituted aryl amine may be dictated by the hexadentate bimetallic complex desired. In another embodiment, R_A , R_B , R_C , and R_D are selected such that an activated transition metal complex of the ligand, in the presence of one or more monomers under suitable polymerization conditions, results in a polymerization product having greater than about 50 weight percent oligomers having from about 4 to about 30 carbon atoms. In another embodiment, the activated complex formed by the above method produces alpha olefins having greater than about 80 percent 1-alkene content. In other embodiments, the pendant groups (including R, W, X, Y, Z, and M groups) of chemical structures V, VI, and VII may be selected such that the hexadentate bimetallic complexes resulting from the above method conform to the various combinations defined above for the ligands and complexes having chemical structures I, II, III and IV.

[0038] In various embodiments, the above method produces the related and desirable ligands and complexes of Table 1:

NUMBER	STRUCTURE
VIII	
IX	
X	
XI	
XII	
XIII	
XIV	

In the chemical structures of Table 1, groups represented by nothing are hydrogen, and groups represented by a single line, broken line, or bold line are methyl.

[0039] In an embodiment, a method for preparing a polymerization catalyst system is provided. The method comprises a coordination reaction between a hexadentate ligand having chemical structure I or II, and having embodiments as set out previously in this application, and a metal salt. The result of the coordination reaction includes a hexadentate bimetallic complex having chemical structure III or IV, and having embodiments as set out previously in this application. The method further comprises generating a metal alkyl or metal hydride species, and contacting the catalyst system with one or more monomers under suitable reaction conditions to polymerize the monomer.

[0040] In another embodiment of the method for preparing a polymerization catalyst, olefins may or may not be present during generation of a metal alkyl or metal hydride species. In another embodiment, the metal hydride or metal alkyl species is generated by a Lewis acid or a combination of a Lewis acid and alkylating agent. Examples of Lewis acids include

(C₆F₅)₃B or (C₆H₅)₃B. An example of a metal hydride is NaBH₄. In another embodiment, the metal hydride or metal alkyl species is generated by an alkyl aluminum compound such as, for example, triethylaluminum (TEA). In another embodiment, the metal hydride or metal alkyl species is generated by an alkyl aluminoxane such as a methyl-aluminoxane (MAO). In another embodiment, the metal hydride or metal alkyl species is generated by a combination of Lewis acids, alkyl aluminums, or alkyl aluminoxanes.

EXAMPLES

EXAMPLE 1

[0041] 1.00g (3.57 mmol) of monoketone 5, which is represented by structure XV:

XV

0.34g (1.42 mmol) of 4,4'-ethylenedi-*m*-toluidine, and 25mg of *p*-toluenesulfonic acid were added to a flask in a drybox. A stirbar was added, followed by addition of 30ml of anhydrous toluene. The reaction was stirred while being refluxed for 5 hours under inert atmosphere. The reaction was allowed to cool, was filtered to remove a very small amount of dark precipitate, and the solvent was then removed *in vacuo*. Ethanol was added to the remaining oil, and the resultant solid (426mg, 39%) was isolated by filtration and identified by ¹H and ¹³C NMR as chemical structure VIII (purity ~ 95%).

EXAMPLE 2

[0042] Chemical structure VIII (150mg, 0.196 mmol) and iron(II)chloride tetrahydrate (0.372 mmol) were added together in a small flask with a stirbar in a drybox. 10ml of anhydrous THF was added, and the reaction was allowed to stir for 18 hours. Pentane was added, and the reaction was filtered and washed with pentane to give 182mg (95% yield, assuming two equivalents of THF per complex molecule) of chemical structure IX.

EXAMPLE 3

[0043] 4.24g (15.1 mmol) of monoketone 5, represented by structure XV, and 1.42g (7.17 mmol) of 4,4'-methylenedianiline were dissolved in 50ml of anhydrous toluene in a drybox. After dissolution of the solids, 3A molecular sieves were added and the solution was allowed to sit for 18 hours. More molecular sieves were then added, followed by the addition of 4 drops of sulfuric acid. The reaction was refluxed for 3 hours, allowed to cool, and then filtered. The solvent was removed *in vacuo*, and ethanol was added. The flask was placed in a freezer at 0°C

overnight, and 1.04g (19%) of solid was removed by filtration after 1 day and identified by ¹H NMR as chemical structure X (~ 95% pure).

EXAMPLE 4

[0044] 2,6-Diacetylpyridine (10.0g, 61.0 mmol) and 4,4'-methylenebis(2,6-dimethylaniline) (6.24g, 24.5 mmol) were dissolved in 300ml of ethanol in an open beaker. 5 drops of acetic acid were added, and the reaction was allowed to sit at 25°C for several days. Several crops of crystals were collected (12.2g, 91%), washed with cold ethanol, and identified by ¹H NMR as chemical structure XII.

EXAMPLE 5

[0045] Chemical structure XII (2.0g, 3.67 mmol) and 4-*t*-butylaniline (1.8ml, 11.3 mmol) were dissolved in 50ml of anhydrous toluene in a flask in a drybox. 3A molecular sieves were added, and the solution was allowed to sit for 3 days. More molecular sieves were added, followed by the addition of 2 drops of sulfuric acid. The reaction was refluxed for 3 hours, allowed to cool, and filtered. The molecular sieves were washed with ethanol. The solvent was removed by filtration, ethanol was added, and a solid was collected by filtration. This solid was recrystallized from an ethanol cyclohexane mixture and identified by ¹H NMR as chemical structure XIII (490mg, 17% yield, ~95% purity).

EXAMPLE 6

[0046] Chemical structure XIII (300mg, 0.372 mmol) and iron(II)chloride tetrahydrate (148mg, 0.744 mmol) were added together in a small flask with a stirbar in a drybox. 15ml of anhydrous THF was added, and the reaction was allowed to stir for 18 hours. Pentane was added, and the reaction was filtered and washed with ether and pentane to give 350mg (78% yield, assuming two equivalents of THF per complex molecule) of chemical structure XIV.

EXAMPLE 7

[0047] Under semi-continuous operating conditions, 120 grams of cyclohexane were pumped into a 1 liter reactor, and the reactor was pressurized with ethylene. Next pumps were used to quickly transfer the first hour's amounts of chemical structure XIV and triethylaluminum (TEA) to the reactor. The hourly flow rates were then set for the catalyst and co-catalyst, and the reaction was allowed to exotherm to the desired run temperature. The reaction was stopped 150 minutes after reaching 50°C. The data in the following table represent the last sample taken before stopping the reaction.

Solvent (120g)	CyH
Catalyst	XIV
Flowrate (mg/hr)	0.2
Yield (g)	374
lb prod/lb Al	5004
lb prod/lb Fe cat ($\times 10^3$)	509
Al:Fe ratio	2000
K(C20/C18)	0.68
K(C16/C14)	0.69
K(C10/C8)	0.69
P ethylene (psig)	500
1-hexene Purity	99.34
C6 % Branched Alpha Olefins (BAO)	0.17
C6 % Paraffin	0.21
1-octene Purity	99.05
C8 % Branched Alpha Olefins (BAO)	0.29

The following chart illustrates the catalyst's high selectivity for ethylene relative to higher olefins:

[0048] While the present invention has been illustrated and described in terms of particular apparatus and methods of use, it is apparent that equivalent techniques and ingredients may be substituted for those shown, and other changes can be made within the scope of the present invention as defined by the appended claims.

[0049] The particular embodiments disclosed herein are illustrative only, as the invention may be modified and practiced in different but equivalent manners apparent to those skilled in the art having the benefit of the teachings herein. Furthermore, no limitations are intended to the details of construction or design herein shown, other than as described in the claims below. It is therefore evident that the particular embodiments disclosed above may be altered or modified and all such variations are considered within the scope and spirit of the invention. Accordingly, the protection sought herein is as set forth in the claims below.

CLAIMS

What we claim as our invention is:

1. A hexadentate ligand for polymerization of olefins comprising chemical structure I:

wherein R_1 , R_2 , and R_3 are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group;

R_4 and R_5 are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl; and

Y_1 is a structural bridge, and W , Y_1 , and Z are independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl having from about 0 to about 30 carbon atoms.

2. The ligand of Claim 1 wherein W , Y_1 , and Z are selected such that an activated transition metal complex of the ligand results in greater than about 50 weight percent of the polymerization product comprising oligomers having from about 4 to about 30 carbon atoms.
3. The ligand of Claim 1 further comprising a mirror plane.
4. The ligand of Claim 1 wherein Y_1 is cyclohexane.
5. The ligand of Claim 1 wherein W , Y_1 , and Z are selected to produce chemical structure II:

wherein R₆, R₇, R₈, R₉, and R₁₀ are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl;

R_A, R_B, R_C, and R_D are each independently hydrogen, fluorine, an inert functional group, a primary carbon group, a secondary carbon group, or a tertiary carbon group;

Y₂ is a structural bridge between two halves of the structure, and more particularly may be a bond, a hydrocarbyl group comprising from about 0 to about 20 carbon atoms, methylene (CH₂), ethylene (C₂H₄), or an inert functional group; and

any two of R_A, R₆, R₇, R_B, R_C, R₈, R₉, R₁₀, and R_D, or any portion of Y₂, vicinal to one another, taken together may form a ring.

6. The ligand of Claim 5 wherein:

when R_A is a primary carbon group, then none, one, or two of R_B, R_C, and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B, R_C, and R_D are hydrogen or fluorine;

when R_A is a secondary carbon group, then none, one, or two of R_B, R_C and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B, R_C, and R_D are hydrogen or fluorine;

when R_A is a tertiary carbon group, then none or one of R_B, R_C, and R_D are tertiary, phenyl, or substituted phenyl, and the remainder are hydrogen or fluorine;

when R_C is a primary carbon group, then none, one, or two of R_A, R_B, and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A, R_B, and R_D are hydrogen or fluorine;

when R_C is a secondary carbon group, then none, one, or two of R_A , R_B and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine; and

when R_C is a tertiary carbon group, then none or one of R_A , R_B , and R_D are tertiary, phenyl, or substituted phenyl, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine.

7. The ligand of Claim 5 further comprising a mirror plane.
8. The ligand of Claim 5 wherein Y_2 connects rings at their respective meta positions and R_7 is located at the respective para positions.
9. The ligand of Claim 5 wherein R_A , R_B , R_C , and R_D are selected such that an activated transition metal complex of the ligand results in greater than about 50 weight percent of the polymerization product comprising oligomers having from about 4 to about 30 carbon atoms.
10. The ligand of Claim 5 wherein R_A and R_B are hydrogen; and R_C and R_D are independently methyl, ethyl, propyl, or isopropyl.
11. The ligand of Claim 10 wherein R_C and R_D are both methyl.
12. The ligand of Claim 5 wherein R_C and R_D are hydrogen; and R_A and R_B are independently methyl, ethyl, propyl, or isopropyl.
13. The ligand of Claim 12 wherein R_A and R_B are both methyl.
14. The ligand of Claim 5 wherein R_A and R_D are hydrogen; and R_B and R_C are independently methyl, ethyl, propyl, or isopropyl.
15. The ligand of Claim 14 wherein R_B and R_C are both methyl.
16. The ligand of Claim 5 wherein Y_2 is a bond, methylene (CH_2), or ethylene (C_2H_4).
17. The ligand of Claim 5 having chemical structure VIII:

18. The ligand of Claim 5 having chemical structure X:

19. The ligand of Claim 5 having chemical structure XII:

20. The ligand of Claim 5 having chemical structure XIII:

21. The hexadentate ligand of Claim 1 reacted to form a hexadentate bimetallic complex having chemical structure III:

wherein M_1 and M_2 are metal atoms that are independently selected from a group comprising cobalt, iron, chromium, and vanadium;
each X is an anion; and
 n is 1, 2, or 3, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 .

22. The complex of Claim 21 wherein M_1 and M_2 are iron.

23. The complex of Claim 21 wherein said complex comprises a mirror plane.

24. The complex of Claim 21 wherein M_1 and M_2 are cobalt.

25. The complex of Claim 21 wherein X , Y_1 , and Z are selected such that greater than about 50 weight percent of the polymerization product made by an activated complex comprises oligomers having from about 4 to about 30 carbon atoms.

26. The complex of Claim 21 wherein the activated complex produces alpha olefins of at least about 80 percent 1-alkene content.

27. The complex of Claim 21 wherein selection of M_1 and M_2 affects selection of X , Y_1 , and Z .

28. The complex of Claim 21 wherein X is a halide or acetyl acetate.

29. The complex of Claim 21 wherein X , Y_1 , and Z are selected to produce chemical structure IV:

wherein R_6 , R_7 , R_8 , R_9 , and R_{10} are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl;

R_A , R_B , R_C , and R_D are each independently hydrogen, fluorine, an inert functional group, a primary carbon group, a secondary carbon group, or a tertiary carbon group; and

Y_2 is a structural bridge between two halves of the structure, and more particularly may be a bond, a hydrocarbyl group comprising from about 0 to about 20 carbon atoms, methylene (CH_2), ethylene (C_2H_4), or an inert functional group; and

any two of R_A , R_6 , R_7 , R_B , R_C , R_8 , R_9 , R_{10} , and R_D , or any portion of Y_2 , vicinal to one another, taken together may form a ring.

30. The complex of Claim 29 wherein:

when R_A is a primary carbon group, then none, one, or two of R_B , R_C , and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B , R_C , and R_D are hydrogen or fluorine; or

when R_A is a secondary carbon group, then none, one, or two of R_B , R_C and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B , R_C , and R_D are hydrogen or fluorine; or

when R_A is a tertiary carbon group, then none or one of R_B , R_C , and R_D are tertiary, phenyl, or substituted phenyl, and the remainder are hydrogen or fluorine; and

when R_C is a primary carbon group, then none, one, or two of R_A , R_B , and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine; or

when R_C is a secondary carbon group, then none, one, or two of R_A , R_B and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine; or

when R_C is a tertiary carbon group, then none or one of R_A , R_B , and R_D are tertiary, phenyl, or substituted phenyl, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine.

31. The complex of Claim 29 wherein M_1 and M_2 are iron.
32. The complex of Claim 29 wherein said complex comprises a mirror plane.
33. The complex of Claim 29 wherein M_1 and M_2 are cobalt.
34. The complex of Claim 29 wherein R_A , R_B , R_C , and R_D are selected such that greater than about 50 weight percent of the polymerization product made by an activated complex comprises oligomers having from about 4 to about 30 carbon atoms.
35. The complex of Claim 29 wherein the activated complex produces alpha olefins of at least about 80 percent 1-alkene content.
36. The complex of Claim 29 wherein selection of M_1 and M_2 affects selection of R_A , R_B , R_C , and R_D .
37. The complex of Claim 29 wherein X is a halide or acetyl acetonate.
38. The complex of Claim 29 wherein R_1 , R_2 , and R_3 are hydrogen;
 R_4 and R_5 are methyl or hydrogen;
 R_6 , R_7 , R_8 , R_9 and R_{10} are hydrogen; and
 R_A , R_B , R_C , and R_D are each independently methyl, ethyl, propyl, or isopropyl.
39. The complex of Claim 29 wherein R_A and R_B are hydrogen; and
 R_C and R_D are independently methyl, ethyl, propyl, or isopropyl.
40. The complex of Claim 39 wherein R_C and R_D are both methyl.
41. The complex of Claim 29 wherein R_C and R_D are hydrogen; and
 R_A and R_B are independently methyl, ethyl, propyl, or isopropyl.
42. The complex of Claim 41 wherein R_A and R_B are both methyl.
43. The complex of Claim 29 wherein R_A and R_D are hydrogen; and
 R_B and R_C are independently methyl, ethyl, propyl, or isopropyl.
44. The complex of Claim 43 wherein R_B and R_C are both methyl.
45. The complex of Claim 31 wherein:
 R_4 and R_5 are methyl;
 R_A and R_B are hydrogen; and
 R_C and R_D are methyl.
46. The complex of Claim 31 wherein:

R_4 and R_5 are methyl;

R_A and R_B are methyl; and

R_C and R_D are hydrogen.

47. The complex of Claim 31 wherein:

R_4 and R_5 are methyl;

R_A and R_C are methyl; and

R_B and R_D are hydrogen.

48. The complex of Claim 29 wherein Y_2 is a bond, methylene (CH_2), or ethylene (C_2H_4).

49. The complex of Claim 29 having chemical structure IX:

50. The complex of Claim 29 having chemical structure XI:

51. The complex of Claim 29 having chemical structure XIV:

52. The complex of Claim 21 further comprising a polymerization catalyst system, the polymerization catalyst system comprising a metal alkyl or metal hydride species.

53. The complex of Claim 52 wherein the metal alkyl or metal hydride species is generated by a compound selected from the group consisting of one or more Lewis acids; a combination of one or more Lewis acids and one or more alkylating agents; one or more alkyl aluminum compounds; one or more alkyl aluminoxanes; methyl aluminoxane; tri-ethyl aluminum; and combinations thereof.

54. The complex of Claim 29 further comprising a polymerization catalyst system, the polymerization catalyst system comprising a metal alkyl or metal hydride species.

55. The complex of Claim 54 wherein the metal alkyl or metal hydride species is generated by a compound selected from the group consisting of one or more Lewis acids; a combination of one or more Lewis acids and one or more alkylating agents; one or more

alkyl aluminum compounds; one or more alkyl aluminoxanes; methyl aluminoxane; tri-ethyl aluminum; and combinations thereof.

56. The complex of Claim 49 further comprising a polymerization catalyst system, the polymerization catalyst system comprising a metal alkyl or metal hydride species.

57. The complex of Claim 56 wherein the metal alkyl or metal hydride species is generated by a compound selected from the group consisting of one or more Lewis acids; a combination of one or more Lewis acids and one or more alkylating agents; one or more alkyl aluminum compounds; one or more alkyl aluminoxanes; methyl aluminoxane; tri-ethyl aluminum; and combinations thereof.

58. The complex of Claim 50 further comprising a polymerization catalyst system, the polymerization catalyst system comprising a metal alkyl or metal hydride species.

59. The complex of Claim 58 wherein the metal alkyl or metal hydride species is generated by a compound selected from the group consisting of one or more Lewis acids; a combination of one or more Lewis acids and one or more alkylating agents; one or more alkyl aluminum compounds; one or more alkyl aluminoxanes; methyl aluminoxane; tri-ethyl aluminum; and combinations thereof.

60. The complex of Claim 51 further comprising a polymerization catalyst system, the polymerization catalyst system comprising a metal alkyl or metal hydride species.

61. The complex of Claim 60 wherein the metal alkyl or metal hydride species is generated by a compound selected from the group consisting of one or more Lewis acids; a combination of one or more Lewis acids and one or more alkylating agents; one or more alkyl aluminum compounds; one or more alkyl aluminoxanes; methyl aluminoxane; tri-ethyl aluminum; and combinations thereof.

62. A method for producing a hexadentate bimetallic complex having chemical structure IV:

comprising:

mixing a pyridine compound having chemical structure V:

with a substituted arylene diamine having chemical structure VI:

and a substituted aryl amine having chemical structure VII:

in a suitable solvent; and

adding at least one metal salt of the formula MX_n ;

wherein R_1 , R_2 , and R_3 are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group;

R_4 and R_5 are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl;

R_6 , R_7 , R_8 , R_9 , and R_{10} are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl;

R_A , R_B , R_C , and R_D are each independently hydrogen, fluorine, an inert functional group, a primary carbon group, a secondary carbon group, or a tertiary carbon group;

Y_2 is a structural bridge between two halves of the structure, and more particularly may be a bond, a hydrocarbyl group comprising from about 0 to about 20 carbon atoms, methylene (CH_2), ethylene (C_2H_4), or an inert functional group;

any two of R_A , R_6 , R_7 , R_B , R_C , R_8 , R_9 , R_{10} , and R_D , or any portion of Y_2 , vicinal to one another, taken together may form a ring;

M_1 and M_2 are independently selected metal atoms that are selected from a group comprising cobalt, iron, chromium, and vanadium;

each X is an anion; and

n is 1, 2, or 3, so that the total number of negative charges on X is equal to the oxidation state of M_1 or M_2 .

63. The method of Claim 62 wherein:

when R_A is a primary carbon group, then none, one, or two of R_B , R_C , and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B , R_C , and R_D are hydrogen or fluorine;

when R_A is a secondary carbon group, then none, one, or two of R_B , R_C and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B , R_C , and R_D are hydrogen or fluorine;

when R_A is a tertiary carbon group, then none or one of R_B , R_C , and R_D are tertiary, phenyl, or substituted phenyl, and the remainder are hydrogen or fluorine;

when R_C is a primary carbon group, then none, one, or two of R_A , R_B , and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine;

when R_C is a secondary carbon group, then none, one, or two of R_A , R_B and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine; and

when R_C is a tertiary carbon group, then none or one of R_A , R_B , and R_D are tertiary, phenyl, or substituted phenyl, and the remainder of R_A , R_B , and R_D are hydrogen or fluorine.

64. The method of Claim 63 wherein M_1 and M_2 are iron.

65. The method of Claim 62 further comprising forming an intermediate hexadentate ligand having chemical structure II:

66. The method of Claim 65 wherein said intermediate hexadentate ligand has a purity of at least about 90 percent when measured by NMR.

67. The method of Claim 65 wherein said hexadentate ligand and hexadentate bimetallic complex each comprise a mirror plane.

68. The method of Claim 62 wherein R_A , R_B , R_C , and R_D are selected such that the activated complex results in a polymerization product comprising greater than about 50 weight percent oligomers having from about 4 to about 30 carbon atoms.

69. The method of Claim 62 wherein the order of mixing said pyridine compound with said substituted arylene diamine and said substituted aryl amine in said suitable solvent is dictated by the complex desired.

70. The method of Claim 62 wherein X is a halide or acetyl acetonate.

71. The method of Claim 62 wherein said method produces a complex having chemical structure IX:

72. The method of Claim 71 wherein an intermediate ligand having chemical structure VIII is formed:

73. The method of Claim 62 wherein said method produces a complex having chemical structure XI:

74. The method of Claim 73 wherein an intermediate ligand having chemical structure X is formed:

75. The method of Claim 62 wherein said method produces a complex having chemical structure XIV:

76. The method of Claim 75 wherein said an intermediate ligand having chemical structure XII is formed:

77. The method of Claim 75 wherein an intermediate ligand having chemical structure XIII is formed:

78. A method for preparing a polymerization catalyst comprising:

executing a coordination reaction between a hexadentate ligand having chemical structure II:

and a metal salt of the formula MX_n to form a hexadentate bimetallic complex having chemical structure IV:

wherein R_1 , R_2 , and R_3 are each independently hydrogen, hydrocarbyl, substituted hydrocarbyl, or an inert functional group;

R_4 and R_5 are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl;

R_6 , R_7 , R_8 , R_9 , and R_{10} are each independently hydrogen, hydrocarbyl, an inert functional group, or substituted hydrocarbyl;

R_A , R_B , R_C , and R_D are each independently hydrogen, fluorine, an inert functional group, a primary carbon group, a secondary carbon group, or a tertiary carbon group;

"Y₂ is a structural bridge between two halves of the structure, and more particularly may be a bond, a hydrocarbyl group comprising from about 0 to about 20 carbon atoms, methylene (CH₂), ethylene (C₂H₄), or an inert functional group;

any two of R_A, R₆, R₇, R_B, R_C, R₈, R₉, R₁₀, and R_D, or any portion of Y₂, vicinal to one another, taken together may form a ring;

M₁ and M₂ are independently selected metal atoms that are selected from a group comprising cobalt, iron, chromium, and vanadium;

each X is an anion;

n is 1, 2, or 3, so that the total number of negative charges on X is equal to the oxidation state of M₁ or M₂; and

wherein olefins may or may not be present when generating a metal alkyl or metal hydride species.

79. The method of Claim 78 wherein:

M₁ and M₂ are both iron;

when R_A is a primary carbon group, then none, one, or two of R_B, R_C, and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B, R_C, and R_D are hydrogen or fluorine;

when R_A is a secondary carbon group, then none, one, or two of R_B, R_C and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_B, R_C, and R_D are hydrogen or fluorine;

when R_A is a tertiary carbon group, then none or one of R_B, R_C, and R_D are tertiary, phenyl, or substituted phenyl, and the remainder are hydrogen or fluorine;

when R_C is a primary carbon group, then none, one, or two of R_A, R_B, and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A, R_B, and R_D are hydrogen or fluorine;

when R_C is a secondary carbon group, then none, one, or two of R_A, R_B and R_D are primary carbon groups, secondary carbon groups, phenyl, substituted phenyl, or inert functional groups, and the remainder of R_A, R_B, and R_D are hydrogen or fluorine; and

when R_C is a tertiary carbon group, then none or one of R_A, R_B, and R_D are tertiary, phenyl, or substituted phenyl, and the remainder of R_A, R_B, and R_D are hydrogen or fluorine.

80. The method of Claim 78 wherein each of said hexadentate ligand and said hexadentate bimetallic complex comprise a mirror plane.

81. The method of Claim 78 wherein R_A , R_B , R_C , and R_D are selected such that an activated complex results in greater than about 50 weight percent of the polymerization product comprises alpha-olefin oligomers having from about 4 to about 30 carbon atoms.
82. The method of Claim 78 wherein M_1 and M_2 are cobalt.
83. The method of Claim 78 wherein X is a halide or acetyl acetonate.
84. The method of claim 78 further comprising adding a metal alkyl or metal hydride species.
85. The method of claim 84 wherein the metal alkyl or metal hydride species is generated by a compound selected from the group consisting of one or more Lewis acids; a combination of one or more Lewis acids and one or more alkylating agents; one or more alkyl aluminum compounds; one or more alkyl aluminoxanes; methyl aluminoxane; tri-ethyl aluminum; and combinations thereof.
86. The method of claim 84 further comprising contacting the catalyst with one or more monomers under suitable reaction conditions to polymerize the monomer.

INTERNATIONAL SEARCH REPORT

International Application No
PCT/US2004/004472

A. CLASSIFICATION OF SUBJECT MATTER
IPC 7 C08F10/00 C07D213/53 C07F15/02

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 C08F C07D C07F

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, CHEM ABS Data

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	EP 1 229 020 A (IDEMITSU PETROCHEMICAL CO) 7 August 2002 (2002-08-07) the whole document	1-86
X	----- DATABASE CAPLUS 'Online! CHEMICAL ABSTRACTS SERVICE, COLUMBUS, OHIO, US; LI, YUESHENG ET AL: "Preparation of iron- or cobalt-based polynuclear pyridine-containing diimine catalysts for olefin polymerization" XP002284349 retrieved from STN Database accession no. 2002:499552 the whole document & CN 1 306 014 CN (CHANGCHUN INST. OF APPLIED CHEMISTRY, CHINESE ACADEMY OF SCIENCES, PEO) 1 August 2001 (2001-08-01) -----	1-86

☐ Further documents are listed in the continuation of box C.

☒ Patent family members are listed in annex.

* Special categories of cited documents :

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

- *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- *Z* document member of the same patent family

Date of the actual completion of the international search

1 July 2004

Date of mailing of the international search report

16/07/2004
